

MA Programme launches Technology Stream

TIIS is delighted to announce the launch this September of a new stream on the MA in Translation and Bilingual Communication focusing on the rapidly-developing area of translation technology. The technology stream provides students with the opportunity to study a wide range of technology-based approaches to translation including the use of translation memory and machine translation, and also certain newly-emerged translation types such as localization and audiovisual translation. Students enrolled on the new stream will make an intensive study of these areas, while most of the stream's new courses will be available to other MATRAN students as electives.

For further details of the programme structure and courses, see:
